# STRUCTURAL PRE-ANALYSIS TABLES

The calculation of KLH solid wood panels is carried out under the aspect of flexibly connected cross sections. The longitudinal layers are connected via flexible transverse layers. Therefore, bending caused by transverse forces (shear deformations of the transverse layers, “rolling shear”) can no longer be disregarded. Dimensioning and structural design follow the Eurocode 5 (EN 1995-1-1 and EN 1995-1-2), taking into account the national standards set forth in ÖNORM B 1995-1-1 and ÖNORM B 1995-1-2. It should be pointed out that the national standards in various European countries differ from each other in some detailed aspects (e.g. different component safety coefficients for “plywood board” material).

The product characteristics of the KLH solid wood panel required for structural design can be taken from the European Technical Approval (ETA-06/0138). The static test for KLH solid wood panels must be made separately for each project, and the locally applicable standards and regulations have to be followed. Due care is also advised when comparing panel thicknesses of KLH elements with

products by other manufacturers: due to different production processes, the plywood board products may well have different properties, e.g. as regards bending stiffness or shear strength. Please read the key values in the relevant product approvals and take into account the differences in the comparative calculation.

For the calculation of plywood board elements, different calculation methods have been developed. The calculation can be carried out with the so-called shear analogy, the  $\gamma$ -method or even as a girder grid. In practical construction work, the  $\gamma$ -method is most often used. It is an approximation method developed for flexibly connected bending girders, but is also applicable for plywood boards. Instead of the flexibility of the connecting devices, the shear deformation of the transverse layers is taken into account. In practical construction work, this method is sufficiently exact. It is also included in the DIN 1052 and the Eurocode 5. For structural design, the net moments of inertia are calculated with a reduction coefficient and the resulting effective moments of inertia provide verification.

## STANDARD PANELS AND PANEL STRUCTURES

### 01 KLH STANDARD PANEL TYPES AND STRUCTURES

#### COVERING LAYER IN THE TRANSVERSE PANEL DIRECTION TT (WALL)

Nominal thickness in mm	in layers	Lamella structure [mm]					Standard panel widths [m]	Maximum panel lengths [m]
		T	L	T	L	T		
57	3 I	19	19	19			2.40 / 2.50 / 2.72 / 2.95	16.50
72	3 I	19	34	19			2.40 / 2.50 / 2.72 / 2.95	16.50
94	3 I	30	34	30			2.40 / 2.50 / 2.72 / 2.95	16.50
120	3 I	40	40	40			2.40 / 2.50 / 2.72 / 2.95	16.50
95	5 I	19	19	19	19	19	2.40 / 2.50 / 2.72 / 2.95	16.50
128	5 I	30	19	30	19	30	2.40 / 2.50 / 2.72 / 2.95	16.50
158	5 I	30	34	30	34	30	2.40 / 2.50 / 2.72 / 2.95	16.50

#### COVERING LAYER IN THE LONGITUDINAL PANEL DIRECTION TL (CEILING/ROOF)

Nominal thickness in mm	in layers	Lamella structure [mm]							Standard panel widths [m]	Maximum panel lengths [m]
		L	T	L	T	L	T	L		
60	3 I	19	22	19					2.40 / 2.50 / 2.72 / 2.95	16.50
78	3 I	19	40	19					2.40 / 2.50 / 2.72 / 2.95	16.50
90	3 I	34	22	34					2.40 / 2.50 / 2.72 / 2.95	16.50
95	3 I	34	27	34					2.40 / 2.50 / 2.72 / 2.95	16.50
108	3 I	34	40	34					2.40 / 2.50 / 2.72 / 2.95	16.50
120	3 I	40	40	40					2.40 / 2.50 / 2.72 / 2.95	16.50
95	5 I	19	19	19	19	19			2.40 / 2.50 / 2.72 / 2.95	16.50
117	5 I	19	30	19	30	19			2.40 / 2.50 / 2.72 / 2.95	16.50
125	5 I	19	34	19	34	19			2.40 / 2.50 / 2.72 / 2.95	16.50
140	5 I	34	19	34	19	34			2.40 / 2.50 / 2.72 / 2.95	16.50

* 300	8 II	80	30	80	30	80			2.40 / 2.50 / 2.72 / 2.95	16.50
* 320	8 II	80	40	80	40	80			2.40 / 2.50 / 2.72 / 2.95	16.50

\* Special panel types

Special panel structures are available on request. By using double layers, for example the longitudinal or transverse rigidity of the panel can be further enhanced. The fire resistance of the KLH solid wood panel can also be influenced by modifying the structures and can eventually be improved in relation to specific project requirements.

STRUCTURAL PRE-ANALYSIS TABLES

## 02 KLH AS AN EXTERIOR WALL

Wind pressure:  $w_k = 0.80 \text{ kN/m}^2$

Minimum panel thicknesses for various fire resistance classes (R0 to R90)

\*) in addition to the own weight of the KLH elements (the own weight of KLH is already taken into account in the table)

Fire resistance: R0 R30 R60 R90

---

**STRUCTURAL PRE-ANALYSIS TABLES**

---

**Service class 1**

Imposed load category A ( $\psi_0 = 0.7$  and  $\psi_2 = 0.3$ ):  $k_{\text{mod}} = 0.8$

Wind loads ( $\psi_0 = 0.6$  and  $\psi_2 = 0$ ):  $k_{\text{mod}} = 0.9$

**Load-bearing capacity**

- a) Test as a buckling bar (compression and deflection according to equivalent beam method)
- b) Test of shear stress

**Structural fire design (one-sided burn-off)**

- a) Charring rate  $\beta_0 = 0.67$  mm/min if the burn-off only takes place in the covering layer or in the top double-layer
- b) Charring rate  $\beta_0 = 0.76$  mm/min if several layers are affected (for the entire time of fire exposure)
- c) Additional eccentricity due to burn-off taken into account

This table is only intended for structural pre-analysis purposes and does not replace necessary static calculations!

STRUCTURAL PRE-ANALYSIS TABLES

## STRUCTURAL PRE-ANALYSIS TABLES

---

### Service class 1

$$k_{\text{def}} = 0.8$$

Imposed load category A and B ( $\psi_0 = 0.7$  and  $\psi_2 = 0.3$ ):  $k_{\text{mod}} = 0.8$

Imposed load category C ( $\psi_0 = 0.7$  and  $\psi_2 = 0.6$ ):  $k_{\text{mod}} = 0.9$

### Deflection limits according to ÖNORM EN 1995-1-1:2010

a) characteristic structural design situation:  $w_{\text{Q,inst}} \leq \ell/300$  and  $(w_{\text{fin}} - w_{\text{G,inst}}) \leq \ell/200$

b) quasi-permanent structural design situation:  $w_{\text{fin}} \leq \ell/250$

### Vibration test according to Eurocode 5 and Kreuzinger / Mohr

a) Attenuation factor  $\zeta = 2.5 \%$ ; cement screed 5 cm; room width  $b = 1.2 \cdot \ell$

b)  $f_1 \geq 4.5 \text{ Hz}$ ;  $w_F \leq 1.0 \text{ mm/kN}$ ;  $v < v_{\text{limit}}$ ;  $a < 0.10 \text{ m/s}^2$  (vibrations considered to be disturbing)

c) Vibration acceleration was tested with an imposed load of the category C, in addition with  $\psi_2 = 0.3$

### Load-bearing capacity

a) Test of bending stress

b) Test of shear stress

### Structural fire design (one-sided burn-off)

a) Charring rate  $\beta_0 = 0.67 \text{ mm/min}$  if the burn-off only takes place in the covering layer or in the top double-layer

b) Charring rate  $\beta_0 = 0.76 \text{ mm/min}$  if several layers are affected (for the entire time of fire exposure)

c) The minimum panel thicknesses (for R0) automatically reach fire resistance according to coloured marking

This table is only intended for structural pre-analysis purposes and does not replace necessary static calculations!
